* Physical Vapor Deposition (PVD)

Pvd is a field in the application of nanotechnology. The process consists of depositing layers of atoms, inside a vacuum chamber, to a solid surface. The layering is produced by the condensation of a vaporized metal (such as gold, titanium, platinum etc.) over the selected surface.

Advantages:

High resistance to abrasion and scratches; much higher than metals applied by firing. Excellent superficial strength. This process is applied in the manufacturing of tools destined to friction related applications. Resistant to chemical products, dissolvents and domestic cleaning products.

Corrosion resistant. ISO 9227

* El Pvd es uno de los campos de aplicación de la nanotecnología. El proceso consiste en depositar capas de átomos, en una cámara de alto vacío, sobre una superficie sólida. El recubrimiento se produce por la condensación de un metal vaporizado, oro, titanio, platino, ect. sobre el material a recubrir.

Ventajas: Alta resistencia al rayado y a la abrasión. Mucho mayor que los metales aplicados por cocción. Excelente dureza superficial. Proceso utilizado en el recubrimiento de herramientas utilizadas en trabajos de fricción. Resistente a productos químicos, disolventes y productos de limpieza de uso doméstico.

Resistente a la corrosión : ISO 9227
